

fetch API

The Fetch API provides an interface for fetching (sending/receiving) resources.

It uses **Request** and **Response** objects.

The **fetch()** method is used to fetch a resource (data).

```
let promise = fetch( url , [options] )
```

Understanding Terms

AJAX is Asynchronous JS & XML

JSON is JavaScript Object Notation

json() method : returns a second promise that resolves with the result of parsing the response body text as JSON. (Input is JSON, output is JS object)

Requests & Response

HTTP Verbs

Response Status Code

***HTTP response headers also contain details about the responses, such as content type, HTTP status code etc.**

Homework Task

Sending POST Request
